

V34 runs. a-c: the dashed lines are Brazil's fitted break-even (first-round loss = switching cost of 73 M USD), EU alone (0.29 points of penalty per 1,000 USD per hectare) and EU + China. d: business-as-usual clearing over five years in each title. The dashed lines are each region's own break-even, fitted on its first-round loss (EU alone and EU + China): beyond it the region joins at once. The markers show convergence: a region can join at once and leave again (DRC, Colombia) or join later, as the club grows (Brazil, South-East Asia, Bolivia, Indonesia, Nigeria). No EU-alone line for Ivory Coast (first-round loss above the switching cost at any charge); none for Indonesia (break-even beyond the plane). The run at 5 % (37 members, 16.2 Mha, −3.5 bn USD) lies above the plane. e: a locked-out region is an outsider at every decision. Filled squares: inside at convergence, in the order of d. Welfare on the decision measure (net of the forest-land wedge term).
